Download it from here. Reset the android bootloader (restore all files to factory default) This one is the most tricky, but we can try. I'm using the Google Mobile USB Driver and this helps me to make my android backup. After making a backup copy of my Android SD card, which is the safest way to restore an SD card, please use the USB Drivers to connect it to PC. Then, in order to remove the bootloader we have to follow the steps below: Boot Android into a recovery mode or choose "reset to factory settings" from the list on the left hand side of the Android Dashboard. Hold the Volume up button and select "Settings" from the menu on the top right of the Android Dashboard. Scroll down to "Developer Options" and tap on it. There is a "Reset Factory Defaults" option that will set the system to its factory default settings. Make sure the option is ticked and tap on "Reset Factory Defaults". For information : Hold the Volume down button and select "Wipe user data" in the Android Dashboard. Tap "OK" Verify that reset was successful. You can do this by holding the volume up button and tapping on "Battery" in the Android Dashboard. You should see a new icon for Android Power in the list. That's all to get rid of the CWM recovery!!! So, now you can do the CWM install. Here is a link of this guide if you would like to try it out: { "name": "command-diff", "version": "2.0.0", "description": "Diff the content of two strings", "main": "index.js", "scripts": { "test": "echo \"Error: no test specified\" && exit 1" }, "repository": { "type": "git", "url": "git+https://github.com/antonyq/command-diff.git", "string 82157476af
